

Server-Side Components

Textbox.io comes packaged with *optional* server-side components that enhance the functionality of the editor.

These server-side components enable:

- **Enhanced Spellchecking** for improved error detection and suggestions as well as greater UI integration.

The Textbox.io server-side components are compatible with Java Application Servers.

See the [installing the server-side spelling component](#) article for more detail and to get started.

Note

If you have already installed the Textbox.io server-side components you'll just need to use the [spelling](#) Textbox.io Client Editor API to reference the URL locations of your installed services.
