

aria-label

```
configuration
  ui
    aria-label
```

The `ui aria-label` property defines the editor's [ARIA label](#). The editor's ARIA label identifies the editor to screen readers and other assistive devices.

When this is not set, the default ARIA label is "Textbox.io Rich Text Editor - <id>" where <id> is the ID attribute of the element used to load the editor. When the editor fullscreen feature is used, this changes to "Textbox.io Fullscreen Rich Text Editor - <id>".

If no ID is available on the target element a random 6 digit number is used instead.

Example Configuration

In this example using default configuration, the ARIA label will be "Textbox.io Rich Text Editor - blog"

```
<div id="blog"></div>

<script type="text/javascript">
var editor = textboxio.replace('#blog');
</script>
```

In this example, a simple `configuration` object is created that specifies a custom ARIA Label.

The ARIA label will literally be "Post Body Text", none of the default label is included in this scenario.

```
var configUi = {
  ui: {
    'aria-label': 'Post Body Text'
  }
};

var editor = textboxio.replace('#targetId', configUi);
```
