

Spelling service

Textbox.io has an enhanced spell-checking feature which requires the use of a Java-based server-side component.

Note:

If you choose not to deploy the [Textbox.io](#) spell checking service, then [Textbox.io](#) will fall back to using the browser's spell checker where available.

To enable the Spelling service on a compatible Java server:

1. Deploy the Spelling services. See [Server-Side Components](#) and [Spell Checking](#) for service deployment instructions.
2. Set the [SpellingUrl](#) control property to point to the spelling service.
3. Add your production and development servers to the "allowed origins" list. See [Setting ports for development server](#) for more information.
